[Русский](#) · [User Guide](#)

Predictable cleaning and checking of Word documents, spreadsheets, CSV, and markup. Works entirely offline.

Why It Exists

A document that has passed through several hands carries the marks of that work: coloured reviewer notes, highlighting, comments, struck-through text, unaccepted revisions. Before submission all of it has to go — and go without taking anything needed with it.

Manual cleaning is unreliable twice over. Something gets missed, and something gets deleted along with what mattered: accept the revisions and a page break goes with them; remove the struck-through text and the paragraph collapses.

Principles

Checking is separate from fixing. First the document is checked and produces a list of findings: where the font is not black, where there is highlighting, fill, strikethrough, comments, unaccepted revisions. You look, then you decide.

For automated pipelines there is a strict check that returns a non-zero code — it can be made a build condition.

Removing struck-through text leaves the structure alone. Only the text goes. Paragraphs, tables, page and section breaks stay — otherwise the document falls apart after cleaning.

Invisible-character cleaning is conservative. Only soft hyphens are removed. Spaces, tabs, breaks, visible hyphens, and line-break control characters are left alone: in a legal document a non-breaking space is there on purpose.

A dry run shows the plan. Before anything changes you can see exactly what will be removed and what will be written to the output.

The report shows the fragment, not coordinates. Every hit is quoted with a piece of text — already as it would look after the edit. Whether the replacement is right can be judged without opening the document.

What It Can Do

area	about
Quality check	font colour, highlighting, fill, strikethrough, comments, revisions
Finalisation	one-step cleanup with a final check
Spacing and punctuation	checking and fixing
Find and replace	including morphological search: by the base form of a word, with case agreement
Styles	headings, appendices, lists, table and figure captions, contents, sections
Anomaly inspector	checking without modifying the document

About Morphological Search

Ordinary find-and-replace is useless in Russian: a word appears in six cases. Here the search runs on the base form, and the replacement phrase agrees in case where needed.

Two modes: replace what was found, or add beside it. The second is for when the old wording may not be removed but the new one must appear.

The report quotes every replacement as a **whole sentence** — full stop to full stop.
